Name:

Stop the server!

Message:

We found a server going out of control. We need to shutdown it immediately, but we cannot contact the administrator right away. We just have login as a normal user. How can we shutdown it?

You can login the server by ssh with given certificate, and user name “ubuntu”.
You can check the server status from http://lambda....

Instructions:

You can see the server enabled shutdown account. So use “su shutdown” to shutdown.
