Name:

Secret Lesson

Message:

After obtaining the email address, assume that you successfully identified the X account the person is managing. Now your task is to review the X posts to follow the digital breadcrumbs and see what you can uncover!

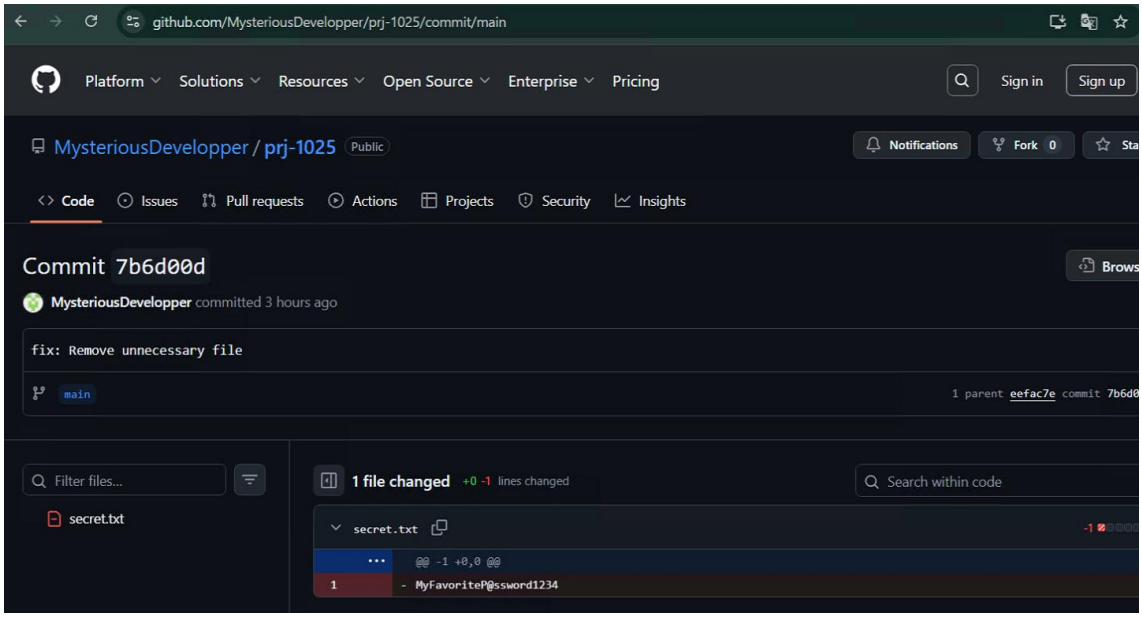

X Account : https://x.com/HayashiMon53687

Hints:

N/A

Instructions:

1. On Monica's X account you'll see a post claiming she accidentally committed an important note to GitHub. Git preserves commit history, so a deleted string can often be recovered from the repository history or from a local clone.
2. Open the repository (or use your local clone) and inspect the commit history for the deleted string "MyFavoriteP@ssword1234".

You can find it using the locally cloned repo as well with useful commands like *git show <commit-hash>*.

3. Going back to the X post you may find a link to “special material for top students.” Navigate to that URL to download a 7z file. You may use the password obtained from GitHub to unzip it.
4. In the link, the instruction suggests that the flag is a combination of the two solutions, joined by a hyphen (-).
    - **Part 1:** The riddle’s keywords — “hook”, “bait”, “urgency”, “credential” — are classic indicators of phishing. So the first part is *phishing*
    - **Part 2**: The encoded string includes == padding, which strongly suggests Base64. Decode with any Base64 decoder to reveal the message *knowledge_is_profit*.
5. Combine these letters with hyphen gives the final flag. Don’t forget the flag format as well!

Flag is:
CSG_FLAG{phishing-knowledge_is_profit}
